

# Workshop

# Build a real application!

- Objective
  - Learn how the Adlib API can be used in one of three possible implementations
- Scenario
  - Build a web application to manage object collections. This application will allow the following operations:
    - search records and navigate the result list;
    - view a record in detail;
    - Create, edit and delete a record.

# Workshop

- Follow the instructions to complete the exercises
- The code for event handling, and html and css processing, is already implemented and you don't need to change it.
- Preview of what you are going to build
  - <http://tom.adlibsoft.com/demojqueryplugin>

## Setup - Wifi connection

- The files needed for this workshop are located on the "tom" server. To access this server, establish the following wireless connection:
  - SSID: adlib-demo
  - WEP key: 1122334455

# Setup - Files for this workshop

- To access the files, use the user **tom\apiguest** and password **api#1**
- Projects:
  - \\tom\workshop\_files\projects
  - Each project has a Solution.txt file with the complete web application code. You can study it in case you have difficulties in completing the exercises.
- Documents with practical examples and instructions:
  - \\tom\workshop\_files\docs
- Participants' projects:
  - \\tom\workshop\_projects
  - Please copy your project to this location, at the end of the work-shop.
